

MANUAL VERSIONING

Make sure to add the running version number of your ufo file in the header of your proof document on every page by typing v.x First however set your font up following these five steps:

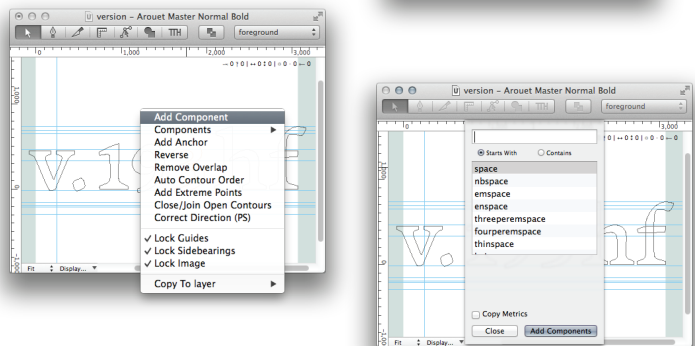

- 1 Create a new glyph

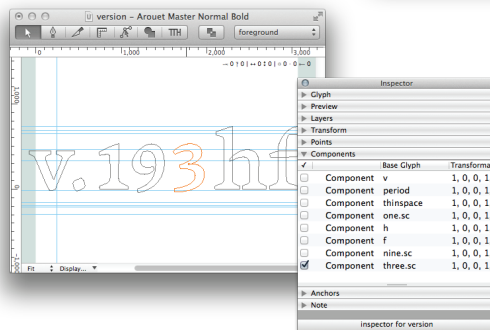

- 2 Call the new glyph **version**

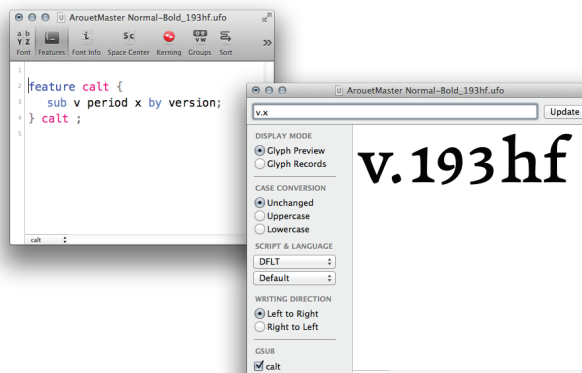

- 3 Right-click (or control-click) anywhere in the empty glyph window to get the context sensitive drop-down window and add the glyphs for your version number as components.

- 4 You can later change the number by selecting any of the components, changing its name in the Inspector window and then hitting the enter key.

- 5 Create the feature code that will automatically change the text **v period x** into the version number in any OpenType aware layout application.

Make sure to test your brand new feature with FontBureau's **Feature Preview** extension.
