

Modifier keys for drafting in RoboFont using the Selection and Scale-Edit tools

- *control-click anywhere* in the Glyph window opens a context sensitive drop-down menu
- *command-click anywhere* in the Glyph window prompts a selection beam that snaps to the closest contour. Holding down shift adds or subtracts from the selection.
- *shift* constrains moves to horizontal, vertical and 45 degree
- *option-click and pull on a contour* adds off-curve points to the path segment
- *option-click and pull on a on-curve point* adds an off-curve point
- *command-click and move on a contour segment* enables “rubber banding” i.e. moving the path-segment and having the off-curve points follow accordingly
- *click-command on a on-curve point* allows the user to move the on-curve point along the tangents while leaving its off-curve points in place (doesn't work if you start with a sharp connection)
- *option-click and move on an off-curve point* turns it's on-curve point into a sharp connection
- *option-click-drag* (selection window) to select only off-curve points
- *option-command-click-drag on off-curve points* to edit handles symmetrically (and turns the on-curve point to a smooth connection)
